Abstract—This paper introduces Smart Prep, an interactive platform where users can choose to interact with an agents or professional team to practice interviewing. During each session, Smart Prep staff, AI agents, ask domain-specific questions, to which users respond by writing or speaking their answers. The agents then analyze these responses and provide users with constructive feedback and suggestions to improve their interviewing skills. Powered by OpenAI ChatGPT and with speech and text capabilities, Smart Prep provides a virtual and helpful environment for users to practice, improving their interview performance. Built with Svelte for front-end and Flask for back-end, Smart Prep demonstrates significant potential as a valuable training tool in professional and educational settings.

Keywords—Smart Prep, Multi-Agent Systems, Prompt Engineering, Interview Simulation, Speech-to-Text, OpenAI API, AI-driven Feedback, Svelte Frontend, Flask Backend, Educational Technology, Skill Development, Realistic Practice Environment, Interactive Learning, Domain-Specific Agents

I. INTRODUCTION

Interview preparation goes beyond rote answers, requiring candidates to build confidence, communication skills, and adaptability. Traditional tools, limited to static question banks or simple chatbots, lack the interactive nature of real interviews. This gap has motivated the creation of Smart Prep—an AI-driven, multi-agent system designed to offer a realistic interview simulation.

AI-powered educational tools have proven effective in enhancing learning through realistic interactions. Domain-specific AI agents can simulate user interactions, increasing engagement and skill acquisition. Additionally, multi-agent systems allow for more complex interactions across fields, setting the foundation for Smart Prep's multi-agent configuration that delivers domain-specific questions and real-time, context-aware feedback.

Most interview tools today depend on static question sets or simple chatbots, unable to adapt to a candidate's responses. They also lack multi-agent frameworks to simulate the natural flow of an interview with follow-up questions and context-aware feedback. This leaves candidates unprepared for real-world interviews, underscoring the need for an advanced solution.

AI-powered educational tools have made significant strides, demonstrating their potential to improve learning through realistic and interactive experiences. For instance, studies have shown that domain-specific AI agents can simulate user interactions effectively, enhancing engagement and skill acquisition in targeted areas [1]. Another study highlights the use of multi-agent systems to gather domain-specific input, improving the quality and depth of interactions [2]. Despite these advancements, tools designed for interview preparation still face notable limitations. Many rely on static question sets or simple chatbots that fail to adapt dynamically to a candidate's responses in real time [3]. Additionally, they lack multi-agent frameworks capable of simulating the natural flow of a real interview, including follow-up questions and context-aware feedback [4]. These gaps underscore the need for a more advanced solution that offers adaptability and personalized feedback, which Smart Prep seeks to address.

This paper presents Smart Prep as a solution to these limitations, bridging the gap between traditional interview tools and candidates' evolving needs. Unlike static tools, Smart Prep's multi-agent framework simulates the fluidity of real interviews, using OpenAI's ChatGPT to provide real-time, personalized feedback. This structure allows Smart Prep to deliver domain-specific questions and contextualized feedback, making it an interactive and effective tool for interview preparation.

The remainder of this paper is organized as follows: Section II presents related work, discussing recent advances in AI-driven interview simulation. Section III details the proposed system architecture, including Smart Prep's use of the OpenAI API for dynamic response generation. Section IV outlines the system's effectiveness based on experimental results, while Section V discusses Smart Prep's contributions and future directions. Section VI concludes, summarizing the impact of this AI-based solution on interview readiness.

II. RELATED WORK

AI-powered chatbots have gained traction in interview preparation, public engagement, and skill development by offering interactive, user-focused environments. These tools provide a flexible, scalable approach for practicing vital skills such as communication, problem-solving, and adaptability. AI bots simulate realistic conversations, enabling users to engage in personalized learning experiences. This section reviews studies advancing AI-driven bots in training and input collection, laying the groundwork for platforms like Smart Prep. These innovations help bridge the gap between traditional training and modern needs, creating dynamic, adaptive platforms that cater to diverse learning styles and offer actionable insights for improvement.

Barambones et al. [1] conducted a study using ChatGPT as a tool to train human-computer interaction (HCI) students on persona creation. By simulating user personas with ChatGPT, students were able to practice identifying and empathizing with fictitious user profiles. The study concluded that AI-generated personas are effective for educational training, as they allow students to gain insights without real user involvement. However, the study pointed out that response variability was limited, which could restrict the authenticity of persona creation in some training scenarios. Smart Prep aligns with this study by utilizing AI-driven responses to allow users to practice and develop interview skills, ensuring that learners can repeatedly engage with domain-specific questions in a controlled, simulated environment before facing real interviewers.

Jiang et al. [2] developed CommunityBots, a multi-agent chatbot platform designed for gathering public input on diverse topics through separate, specialized agents. In CommunityBots, each agent is designated to handle conversations in a specific domain, such as healthcare or work, and the Conversation and Topic Management (CTM) mechanism ensures seamless transitions between topics and agents, reducing conversational interruptions. This multi-agent design resulted in higher engagement and response quality, as users could interact more comfortably across domains. While Smart Prep focuses on interview preparation rather than public input, it could similarly benefit from adopting domain-specific agents to handle questions in areas such as technical skills, behavioral assessment, and situational judgment. This would enable users to receive tailored, domain-relevant feedback, fostering a more in-depth interview practice experience.

Gul et al. [3] focused on self-assessment in interview preparation, introducing a bot capable of analyzing video and audio data to provide feedback on a user's emotional expression and confidence levels. Leveraging NLP for semantic understanding and CNNs for visual analysis, this bot offered a feedback loop for users to assess and refine their readiness in terms of both technical and soft skills. The study highlights the importance of emotion and confidence in interview success, areas that Smart Prep also seeks to address by providing constructive feedback on users' answers. This self-assessment model complements Smart Prep's feedback mechanism, offering users additional insights into their non-verbal cues and emotional readiness, which are critical in real-world interview settings.

Waghmare et al. [4] designed an interactive chatbot for interview preparation that utilizes ChatGPT and Whisper APIs to create a bidirectional interview simulation. This system allows users not only to answer questions but also to ask the chatbot clarifying questions, mimicking the dynamic nature of real interviews. Built on React and FastAPI, this bot offers a modern approach to training, addressing key aspects such as user engagement and realistic conversational flow. This research aligns closely with Smart Prep's objective, particularly in how both platforms create immersive environments for users to enhance their interview performance. By including both text and voice response options, Smart Prep mirrors the interactive dialogue model used by Waghmare et al., facilitating an experience that mirrors the spontaneity and engagement of actual interviews.

TABLE I. COMPARISON OF AI-BASED INTERVIEW PREPARATION TOOLS

Feature	Smart Prep	Community Bots [2]	Self-Assessment Bot [3]	AI Bot For Interview Preparation [4]
Multi-agent system	Yes	Yes	No	No
Real-Time Feedback	Yes	No	Yes	Yes
Domain-Specific Agents	Yes	Yes	No	No
Adaptive Prompting	Yes	No	Yes	Limited
Feedback Type	Contextual	General	Emotion/Confidence	Basic

Recent studies show that AI plays a key role in improving interview preparation. Mandal et al. [10] and Suen et al. [9] discussed how emotion analysis and personality prediction help in candidate evaluation. Lee and Kim [8] focused on detailed assessment methods, while Albassam [6] and Nawaz et al. [7] highlighted the benefits of AI for scalability and personalization. Jöhnk et al. [5] talked about the importance of preparing organizations for AI adoption. *Smart Prep* builds on these ideas by adding domain-specific agents and adaptive feedback to meet modern interview training needs.

Although recent advances have improved interview preparation tools, many still fail to capture the dynamic nature of real interviews. These tools often lack adaptability and the ability to offer domain-specific, real-time feedback. As shown in Table I, *Smart Prep* bridges this gap with a multi-agent framework that tailors feedback to each user's progress. It adapts based on the user's journey, continuing where they left off. This design creates a more realistic, evolving interview experience. It helps users build confidence and better prepares them for live interview challenges.

III. PROPOSED SYSTEM : SMART PREP

Smart Prep is a platform designed to help users practice interviews with AI-powered agents or virtual teams. It brings together different technologies to improve user experience, performance, and flexibility while allowing future upgrades. It uses Svelte for the frontend, Flask for backend processing, and OpenAI's API to generate real-time feedback. The overall design of Smart Prep is shown in Fig. 1.

Fig. 1. Architecture of Proposed Smart Prep

Research Components and Decision-Making :

Throughout the development of Smart Prep, various technological options were explored to determine the best fit for each component. For the frontend, frameworks like React, Angular, and Svelte were reviewed to assess their speed and efficiency. Finally, Svelte was selected due to its compile-time optimization, which reduces memory use and shortens load times, enhancing responsiveness. On the backend side, options such as Django, Node.js, and Flask were considered. Flask's streamlined and adaptable structure stood out as the ideal choice, supporting a high volume of concurrent requests while keeping the platform modular and scalable. To provide real-time, adaptive feedback, several NLP models were evaluated, with OpenAI's API emerging as the most contextually aware and effective for simulating interview dynamics. Each decision reflects a thorough balance between performance, flexibility, and ease of integration, creating a seamless and adaptive interview practice experience for users across various scenarios.

System Architecture Overview :

The Smart Prep platform is built on a robust client-server architecture, designed to streamline communication between the user interface and backend services for a seamless experience. This architecture ensures an organized flow of information, where every user interaction is efficiently captured, processed, and responded to in real-time. Comprising three core layers—the user interface, backend server, and external API integrations—this model divides responsibilities clearly to maximize efficiency and responsiveness. The user interface enables users to interact with the system smoothly, while the backend server manages data processing and business logic. Meanwhile, external APIs, such as the OpenAI API, provide core functionalities, enhancing both user experience and system performance.

- The Smart Prep platform provides an intuitive interface for interactive interview practice. Users can select agents, respond via text or speech, and receive instant feedback, creating an engaging and effective preparation environment.
- The backend handles requests from the UI, manages core logic, and connects with external APIs to ensure smooth, responsive operation.
- Smart Prep uses the OpenAI API to provide customized, context-aware responses, giving users realistic interview practice. By tailoring feedback based on the interview type, Smart Prep helps users prepare effectively with specific tips and authentic scenarios, making it an intelligent, engaging tool for interview readiness across different fields.

Fig 1. illustrates the flow of data and control through these components, showing how the various elements interact to provide a unified user experience.

A. User Interface with Svelte

Svelte is used to build the user interface of Smart Prep. Unlike traditional JavaScript frameworks, Svelte shifts much of the work to compile time, resulting in optimized, efficient code that enhances performance. Svelte was chosen specifically for its ability to reduce the size of the frontend codebase, minimizing both load times and memory usage, which is crucial for delivering a responsive and interactive user experience.

In the context of Smart Prep, the Svelte frontend plays a critical role in managing user interactions. It allows users to:

- Select an interview agent from a list of available agents, each of which is tailored to simulate a specific type of interview.
- Respond to interview questions by either typing or using the speech-to-text functionality.
- View real-time feedback generated from the responses, enabling users to adjust their answers and improve their interview performance.

Svelte updates the interface immediately when users interact, like answering questions or choosing agents, ensuring a seamless experience. Its flexible design also makes it easy to add features like more interview types or real-time analytics.

B. Backend Processing with Flask

Flask was chosen for its simplicity and flexibility, making it perfect for handling many requests while keeping the codebase easy to manage. It handles server tasks like routing, session management, and connecting to external APIs.

Fig. 2. Backend Processing Workflow Diagram

When the Svelte frontend sends a request—such as when a user answers a question—the request is sent to the Flask backend, which processes it in the following stages, as show in Fig. 2:

1. **Routing Requests:** Flask directs user inputs to the right handler for processing.
2. **Interaction with OpenAI API:** Flask forwards the user’s input to the OpenAI API for processing. The API generates a response based on the user's input.
3. **Session Management:** Flask also tracks user sessions using unique thread and message IDs, ensuring that all inputs and responses are properly organized.
4. **Returning Feedback:** After processing the response from the OpenAI API, Flask sends the feedback back to the frontend, where it is displayed to the user in real-time.

C. Integration with OpenAI API

The integration with the OpenAI API is one of the core components of Smart Prep. The OpenAI API is known for its advanced natural language processing (NLP) capabilities, which allow for the generation of highly relevant and contextually appropriate feedback. In Smart Prep, this capability is used to simulate realistic interview scenarios by generating dynamic responses based on user inputs.

- User answers are sent to the OpenAI API for processing.
- The API gives feedback, including suggestions and alternative ways to respond.
- Flask sends this feedback to the Svelte frontend, which displays it to the user immediately.

This integration allows Smart Prep to adapt to each user’s response, providing personalized feedback. It ensures users are practicing with real-time, dynamic interactions rather than static questions and answers.

D. Agent Configuration and Prompt Design

In Smart Prep, the interview agents are skillfully designed using prompt engineering techniques to replicate various types of interviews, creating a highly adaptive and realistic experience. Instead of relying on static, pre-written questions, these agents dynamically adjust their inquiries based on the type of interview selected. This adaptability is achieved through advanced prompts that guide the OpenAI API to generate questions specifically to each interview style.

This dynamic, context-specific approach ensures that the practice sessions are closely aligned with real-world interview situations. Users are exposed to varied and comprehensive scenarios, making them better prepared for different interview formats.

E. Speech-to-Text Functionality

A key feature of Smart Prep is its speech-to-text functionality, which allows users to respond to questions verbally, simulating a more natural interview environment. This feature enhances the realism of the platform, as users can practice their verbal communication skills—a critical aspect of real-life interviews. The steps involved in the speech-to-text functionality are illustrated in Fig. 3.

Fig. 3. Speech-to-Text Process Diagram

The speech-to-text module works as follows:

1. Users speak their answers into their device’s microphone.
2. The spoken input is transcribed into text by the speech-to-text engine.
3. The transcribed text is sent to the Flask backend for further processing, just like a typed response.

- Feedback is generated in the same manner and returned to the user, allowing them to improve both their verbal and content-related aspects of communication.

This feature is particularly valuable for users who want to practice answering questions verbally, helping them gain confidence in delivering responses out loud and refining their verbal communication skills.

F. Session Tracking with Thread and Message IDs

Session tracking in Smart Prep is managed using a combination of thread and message IDs. Each interaction is associated with a unique thread ID, which links together all related messages and feedback from that session.

- Thread IDs** ensure that all user interactions within a specific session are grouped together, allowing users to review entire sessions, including questions, answers, and feedback.
- Message IDs** are assigned to individual exchanges within the session, ensuring that each question-answer pair is uniquely identifiable

G. Scenario of an interviewee giving an interview

Here is the scenario where Interviewee introducing herself or himself and selecting the DevOps Engineer, HR Manager, and Software Engineer as interviewers for the interview.

The process begins with the interviewee introducing themselves, as depicted in Fig. 4. These agents then ask questions separately, analysing her answers and providing insights into areas she needs to focus on for her main interview, along with suggestions for self-improvement.

Fig. 5. illustrates the questions posed by the DevOps Engineer, HR Manager, and Software Engineer during the interview. The evaluation of the interviewee's answers is detailed in Fig. 6.

Further, Fig. 7. highlights the evaluation conducted by each interviewer individually. Finally, the overall evaluation and suggested improvements for the interviewee are summarized in Fig. 8.

Fig. 4. Interviewee introduces him/her self

Fig. 5. The questions asked by DevOps Eng., Software Eng., and HR Manager

Fig. 6. Evaluation of the answers given by the interviewee

Software Engineer Evaluation: - OOP: You have provided a concise overview of Object-Oriented Programming principles and their significance. - Scalable System: Your explanation of techniques for handling high user requests and optimizing databases is accurate. - SDLC Stages: You've mentioned the main stages of the software development life cycle. - Code Quality: You've highlighted important practices such as code reviews, automated testing, and documentation. - Testing Types: Your descriptions of unit testing, integration testing, and end-to-end testing are correct. - Database Optimization: Your points about database optimization techniques are accurate for improving performance. - Design Patterns: You've identified some common design patterns and their usefulness. Suggested Improvement: Providing examples of projects where you have applied these concepts or practices would make your answers more compelling. HR Manager Evaluation: - Background: You have briefly shared your tech background, emphasizing relevant skills and roles. - Interest in Role: You've explained how your skills align with the company's mission and the requirements of the HR role. - Project Achievement: You've mentioned solving complex problems or achieving significant results in past projects. - Handling Pressure: Your approach to managing tight deadlines and focusing on solutions is well-explained. - Time Management: Your suggestion of using tools like task lists and time blocks is effective for prioritizing tasks. - Conflict Handling: Your approach to conflict resolution, including active listening and finding common ground, is appropriate. - Staying Updated: Your strategy for staying updated with industry trends and continuously learning is commendable.
--

Fig. 7. Evaluation done by All individual Interviewers

Suggested improvement: Providing examples of projects where you have applied these concepts or practices would make your answers more compelling. HR Manager Evaluation: - Background: You have briefly shared your tech background, emphasizing relevant skills and roles. - Interest in Role: You've explained how your skills align with the company's mission and the requirements of the HR role. - Project Achievement: You've mentioned solving complex problems or achieving significant results in past projects. - Handling Pressure: Your approach to managing tight deadlines and focusing on solutions is well-explained. - Time Management: Your suggestion of using tools like task lists and time blocks is effective for prioritizing tasks. - Conflict Handling: Your approach to conflict resolution, including active listening and finding common ground, is appropriate. - Staying Updated: Your strategy for staying updated with industry trends and continuously learning is commendable. Suggested improvement: It would be helpful to provide more specific examples or stories to demonstrate your achievements and experiences in HR roles. Overall, your answers show a good understanding of the key concepts and practices relevant to each role. To enhance your answers, consider providing specific examples that showcase your experience and accomplishments in each area. Additionally, ensure that your responses are tailored to the specific role you are applying for and emphasize how your skills and experiences align with the requirements of that role.

Fig. 8. Conclusion and Overall evaluation and improvements

IV. EXPERIMENTS AND RESULTS

Smart Prep is an interactive platform that uses the OpenAI ChatGPT API for realistic interview practice. A study was conducted to assess its effectiveness in improving interview skills, with participants from various professional backgrounds. The platform allows users to practice at their own pace, making it flexible for different learning styles.

A. User Feedback Mechanism

Post-session surveys were collected to gather user insights. Feedback focused on usability, question relevance, and feedback quality. This helps Smart Prep improve continuously based on user needs.

B. Key Findings from User feedback

Table II. presents the summarized responses from the user survey, highlighting overall satisfaction and effectiveness

TABLE II. SUMMARY OF USER FEEDBACK RATINGS

Feedback Criteria	Positive Responses(%)	Neutral Responses (%)	Negative Responses (%)
Ease of Use	80%	15%	5%
Visual Design & UI	85%	10%	5%
Relevance of Questions	90%	7%	3%
Clarity of Feedback	85%	12%	3%

The results indicate that the majority of users found Smart Prep easy to use, visually engaging, and highly relevant to their interview preparation needs. The clarity of feedback also received a strong positive response, reinforcing the platform's effectiveness.

C. Observed Improvement in Interview Skill

Improvement in Skills A scoring system tracked users' progress, showing improvement over time:

Example Observations:

Initial Interactions: In initial responses, users averaged a baseline score of around 60%, indicating areas for growth in interview readiness.

Subsequent Interactions: As users continued practicing and incorporating feedback, average scores increased to around 75%, indicating substantial progress.

Advanced Practice: Many users achieved an average score of 85% or higher after repeated engagement, demonstrating significant improvement in clarity, structure, and confidence in their responses.

D. Quantitative Insights from User Experience

Table III. presents the observed response times for different interaction types, highlighting the efficiency of Smart Prep.

TABLE III. EFFICIENCY OF RESPONSE

Interaction Type	Average Response Time
Short Question	3.0 Sec
Long Question	5.0 Sec
Agent Switching	1.5 Sec

V. DISCUSSION AND FUTURE WORK

Smart Prep is a significant step forward in interview preparation, providing realistic simulations and valuable feedback. Its strengths include adaptive feedback and interactive design that mimic real-world scenarios, boosting users' confidence and skills. However, it has some limitations, such as reliance on internet connectivity and potential variations in responses, which should be considered when evaluating its effectiveness.

A. Strengths of Smart Prep

Smart Prep's strengths are rooted in its ability to deliver automated, objective feedback within a realistic and engaging practice environment. By leveraging OpenAI's advanced language models, Smart Prep can provide nuanced evaluations that account for various factors in user responses, including clarity, relevance, and engagement. This capability significantly reduces the potential for biases that might arise in traditional human feedback mechanisms, fostering a fairer assessment of user performance. Additionally, the platform's session tracking allows users to build on their previous interactions, facilitating continuous skill development and enabling candidates to progressively enhance their interview readiness over time. By simulating real-world interview scenarios, Smart Prep instills confidence and prepares users for diverse professional challenges.

B. Use of OpenAI Models

The decision to utilize OpenAI's models stems from their proven reliability and sophisticated understanding of human language. OpenAI's technology offers a scalable solution that can quickly adapt to various interview contexts, providing high-quality, context-aware feedback. This approach not only accelerates the development process but also minimizes the significant resource investment typically required to train a custom model from the ground up. By integrating OpenAI's established API, Smart Prep can prioritize user experience and functionality, ensuring that candidates receive immediate, relevant feedback that enhances their preparation efforts. Furthermore, the adaptability of OpenAI's models allows Smart Prep to remain at the forefront of advancements in natural language processing, continually evolving to meet user needs.

C. Limitations

Despite the advantages of using OpenAI's models, Smart Prep faces certain limitations. The reliance on an external API can restrict the extent to which the system can be customized for specific interview scenarios, potentially limiting its effectiveness in niche fields or specialized interview techniques. Additionally, the current focus on English may hinder accessibility for non-native speakers, as nuances in language and cultural context may not be fully captured in the feedback. This limitation can affect the overall user experience and the relevance of insights provided to a diverse user base.

D. Future Work

Looking ahead, Smart Prep aims to explore the development of a custom model tailored to the specific needs of interview preparation. This would enable greater control over the training data and the adaptability of the model to different interview formats and user demographics. In conjunction with this effort, expanding language

support will be a key focus, allowing Smart Prep to reach a broader audience and provide more inclusive feedback. Additionally, implementing advanced techniques for bias reduction will further enhance the platform's effectiveness, ensuring that all users receive fair and relevant assessments. Through these future enhancements, Smart Prep aspires to solidify its position as a leading tool for comprehensive interview preparation, offering an enriching experience for users from diverse backgrounds.

VI. CONCLUSION

In conclusion, Smart Prep marks a notable progress in the field of interview preparation by integrating innovative technologies that enhance users' readiness for professional roles. Through the use of OpenAI's advanced language models, the platform provides personalized, unbiased feedback aligned with specific professional sectors. Its distinctive multi-agent system creates diverse interview scenarios, helping users adapt to various interview formats with greater confidence. By utilizing the OpenAI API, Smart Prep ensures real-time, context-sensitive feedback, which allows the platform to evolve based on user needs, offering a highly responsive and effective learning environment.

Looking to the future, Smart Prep has considerable potential for growth. Plans to develop a custom model suited to particular user needs and expand the platform's multilingual capabilities will improve both accessibility and its overall impact. With these enhancements, Smart Prep aims to become an indispensable tool in the hiring process, fostering a better alignment between employers and job candidates. As the platform evolves, it will contribute not only to individual performance but also to a more inclusive and effective recruitment system.
